January 2022

## Online Appendix A: Sample, treatment assignment, and intervention creation details

This appendix describes the middle school selection and randomization process in more detail. It also includes more information on the production and content of intervention materials, as well as additional tables and figures.

## A. 1 Sampling and treatment assignment

## A.1.1 Sampling

To identify middle schools for participation in our interventions, we began with two school-level datasets from the NYCDOE: the 2015-16 Demographic Snapshot, and a list of the most current schools in operation (LCGMS extract from July, 2016). We excluded District 75 (special education) and District 79 (alternative education) schools, but retained charter schools. We identified 603 schools that enrolled a minimum of 30 students in 8 th grade or had zero 8 th graders but at least one student in 7 th grade. (This second condition retained some newer schools that did not serve 8 th grade in 2014-15 but may have in 2015-16). We then excluded 11 schools that were closed or consolidated in summer 2016. This resulted in 592 remaining schools - what we refer to as the "All Schools" sample.

These 592 schools were divided into three "tiers." Tier 1 were schools that were assigned to treatment in our 2015-16 intervention, which recruited high- and medium-poverty schools. These schools participated in our 2016-17 intervention and were guaranteed assignment to a treatment. Tier 2 were schools that were recruited for our 2015-16 intervention but declined to participate, as well as any additional schools that had a population with poverty greater than 50 percent and less than 50 percent of 8 th graders returned to their school for 9 th grade. ${ }^{46}$ Tier 3 were the remaining schools-schools that were relatively low poverty (less than $50 \%$ ) or schools where more than half of the students returned to the same school for 9 th grade. Schools in Tier 3 did not participate in the experiment. However, there were a few exceptions to these general rules, detailed below.

In the 2015-16 experiment, 170 schools were assigned to treatment, however, there were some alterations for 2015-16 described here. Five schools that participated in the 2015-16 experiment were moved to Tier 2 because they were either volunteer schools that received a treatment with certainty or gifted and talented schools that were assigned to the control group with certainty. Four schools were merged with other schools in Tier 1. That left 161 schools in Tier 1. There were 312 Tier 2 schools. Tier 2 was divided into three groups of schools for purposes of forming randomization blocks: 147 schools who were recruited for the 2015-16 study but declined to participate, 123 schools that had poverty rates greater than 50 percent and no returning 8th graders or had moved from Tier 1, and 42 schools that had poverty rates greater than 50 but had some returning 8 th graders (fewer than 50\%). All remaining 119 schools were Tier 3.

Table A. 1 provides mean characteristics of: (1) all NYC schools that served 8th grade in 2015-16 or served 7 th grade in $2015-16$ with the potential to serve 8 th grade in 2016-17 ( $\mathrm{N}=592$ ); (2) all

[^0]study schools ( $\mathrm{N}=473$ ); (3) Tier 1 schools ( $\mathrm{N}=161$ ); and (4) Tier 2 schools ( $\mathrm{N}=312$ ). By design, study schools enrolled a population that is more low-income and are less likely to serve 9th grade students. Similarly, study schools had a larger percentage of Black and Hispanic/Latino students, as these populations are larger in low-income schools. Tier 1 schools were higher poverty than Tier 2 schools - this is because the 2015-16 study focused on recruiting the highest poverty middle schools in NYC. Lower ELA and math scores in the study schools, and specifically in the Tier 1 schools, reflect the focus on higher poverty schools. Tier 1 schools contained no schools from Staten Island because this borough was excluded from the 2015-2016 study.

Table A. 2 provides mean outcomes of the high school admissions process in 2015-16 for the same four groups of schools. (For Tier 1 schools, these outcomes were influenced by our 201516 interventions). In that year, 8th graders in our study schools applied to high schools with lower graduation rates, on average, then did students in the full population, though the differences were small. Study schools included a larger share of high schools on their applications with limited unscreened admissions method (perhaps due to a focus on these schools in the 2015-16 experiment), and a smaller share of students were unmatched after the main round. Study schools also had a higher proportion of schools with graduation rates lower than $70 \%$ on average.

## A.1.2 Treatment Assignment

Randomization was conducted within the two tiers described above. Schools in Tier 1 were randomly assigned to a treatment group. Schools in Tier 2 were randomly assigned to a treatment group or a control group. Since our treatment involved sending materials to the school counselor, we did not recruit schools to participate in the study. School counselors either received materials and supportive contact from the study office or they did not, and they could decide to use the materials, or not. As Tier 1 was made up of schools that participated in our 2015-16 experiment where school counselors may have been able to provide prior years' materials to students, and for ethical reasons, we decided that all schools in Tier 1 would receive a treatment, even if they were assigned to control in 2015-16. Thus, these schools contribute to estimating contrasts across treatments, but not comparisons to the control group. The designed randomization is summarized in Figure A.1.

We retained the 39 blocks formed by matching in the previous year. See the appendix to Corcoran et al. (2018) for details on that randomization process. Within these 39 extant blocks, typically of four schools, schools were randomly assigned to one of the three Fast Facts treatments (the typical Fast Facts list, one which discouraged application to two schools with low odds of admission, and one which discouraged application to two schools low graduation rates), School Finder, or the App. We emphasized randomization to one of the Fast Facts tools since guidance counselors were already familiar with Fast Facts from their exposure in the prior year. By block, the Fast Facts schools within the block were randomly assigned to either digital only delivery or digital and paper delivery. In Tier 1, 114 schools were assigned to Fast Facts, 24 to the App, and 23 to School Finder. Within Fast Facts, half (57) of the schools were assigned to digital only delivery and half to digital and paper; a third (38) were assigned to each version of the Fast Facts sheet. We performed 102 randomizations of Tier 1 as described here, and selected the iteration with the best balance over school characteristics, as per standard practice with RCTs (Bruhn and McKenzie, 2009). School-level covariate balance is reported in Table A.3; $p$-values from joint hypothesis tests that the school characteristics are equal for each treatment group compared to the School Finder group (as there is no control group in Tier 1), controlling for block fixed effects, are reported in the
table and are generally high.
There were two adjustments made to Tier 1 after randomization occurred due to school closures in the summer of 2016 , one of these schools was assigned to Fast Facts "low odds" with digital only delivery, and one to School Finder. Since it was not possible to deliver an intervention to these schools, they are excluded from the analysis. (Additionally, while the closures were non-random, assignment to treatment was, so these drops orthogonal to randomization and should not affect inference.) Final treatment assignments in Tier 1 were thus: 113 to Fast Facts, 24 to the App, and 22 to School Finder, with 57 Fast Fact schools assigned to digital and paper delivery, and 56 to digital only delivery. 38 Fast Fact schools were assigned to receive the unaltered Fast Facts sheets, 38 to the low graduation treatment, and 37 to the low odds treatment. These changes do not greatly affect covariate balance, as shown in Table A.4.

Randomization for Tier 2 consisted of schools new to the study in 2016-17, which were high and medium poverty schools in NYC, as described above. Schools were randomized regardless of their intent to participate; that is, we did not recruit schools in advance for participation. We then blocked these schools into blocks of six schools (where possible). With six schools in a block, the modal block assigned one school to each of the three Fast Facts versions, one school to School Finder, one to the App, and one to control. Blocks were thus matched sextuplets of schools selected using a Mahalanobis distance measure of difference between schools (see Bruhn and McKenzie 2009; King et al. 2007). School variables used in the matching procedure included prior choice outcomes (e.g., the mean graduation rate of first round matches in 2015-16), prior achievement (mean ELA and math scores in 2015-16), economic disadvantage (the percent of students in poverty), and school size. If information on test scores or choice history was missing, we imputed values using the predicted value from a regression of schools with non-missing data.

To maintain face validity, blocking was conducted within borough, and geographically isolated schools were blocked together (i.e. the Rockaways and Staten Island). Additionally, schools were blocked within categories based on their response to recruitment for the 2015-2016 experiment so that blocks were formed within groups of schools that had similar characteristics (e.g. school has returning 8th graders, school that did not choose to participate in 2015-2016, school new to study, etc.) Within these blocks, schools were randomly assigned to a treatment arm or control. The blocks were then listed in a random order and a cross randomization that alternated Fast Facts delivery method (digital only or digital and paper) within block was implemented. 136 schools were assigned to one of the three Fast Facts treatments, 58 to the App, 58 to School Finder, and 60 to control. Within the Fast Facts treatment, 68 schools each were assigned to digital or digital and paper delivery of the intervention. 45 schools were assigned to Fast Facts and Fast Facts low graduation, with 46 schools assigned to Fast Facts low odds. As in Tier 1, multiple iterations (150) of randomization were conducted, with the randomization that had the best balance selected as the final randomization. Table A. 5 shows covariate balance in Tier 2 ; the relevant joint $p$ values comparing each treatment group to the control group are reported at the bottom of the table. Again, there were some post-randomization adjustments made to treatment assignment after randomization occurred. We divide these into two categories. The first are changes in status that are unrelated to treatment assignment, typically school closures. The second are changes in treatment assignment due to the study. The former changes are orthogonal to treatment status and thus should not effect inference. The latter are nonrandom, and thus for these schools we assign them to their original treatment status and estimate intent-to-treat effects.

1. Post-randomization treatment status changes that are orthogonal to random assignment:

- Consolidations:
- Two Tier 2 schools were consolidated into a single school. Both schools had been assigned to Fast Facts low graduation, though one to digital delivery and one to digital and paper delivery. Since this consolidation was independent of any random assignment, we continued with the school that absorbed the other school, which was the one assigned to digital and paper delivery. Thus one school was dropped from the count of Fast Facts, low graduation, digital only delivery.
- A Tier 2 school and a Tier 1 school were consolidated into the Tier 1 school. We retained the Tier 1 assignment, because that school was the "receiving" school and thus lost a Tier 2 assigned to Fast Facts, full list, digital only delivery.
- Two Tier 2 schools were consolidated into a single school. One school had been assigned to Fast Facts, digital delivery and one to the Fast Facts, low graduation, digital delivery. Since this consolidation was independent of any random assignment, we continued with the school that absorbed the other school, which was the one assigned to Fast Facts. Thus one school was dropped from the count of Fast Facts digital low-graduation.
- Did not serve 8th grade:
- A Tier 2 school assigned to the App stopped serving 8th graders, and thus was dropped from the experiment.
- A Tier 2 school which was assigned to control did not serve 8th graders; it was dropped from the analysis. We ran nearest neighbor matching on the remaining Tier 3 schools in the appropriate geographical area and drew a new, untreated school to serve as a control.

Five Tier 2 schools were excluded from the analysis, closed, or absorbed into another school. Ultimately, 308 of 312 schools were in Tier 2 after these adjustments, including the school that was randomly pulled from Tier 3. Fast Facts was assigned to 133: 68 schools were assigned to digital and paper delivery and 65 to digital delivery. Within Fast Facts types, 44 were assigned to the standard list, 43 to the low graduation list, and 46 to the low odds list. 58 schools remained in the School Finder treatment with 57 schools in the App treatment. There were 60 control schools accounting for the control school that was lost as described above, with one the substitution also described above. School-level covariates remain balanced after these adjustments, as shown in Table A.6. The treatment assignment after these random treatment status changes is what we used in the analysis, which an intent-to-treat analysis since the nonrandom post randomization changes described below were assigned to their original status. We show this assignment in Figure A.2.
2. Post-randomization treatment status changes that were nonrandom:

- Shared guidance counselors:
- Two nearby Tier 2 schools shared a guidance counselor. To ensure both schools received the same treatment, they were both assigned to a single treatment (Fast Facts, low graduation version, digital and paper delivery). This was the assigned treatment of one of the schools. The second school was originally assigned to receive the App, and received the treatment described above instead. This school is included in the analysis with assignment to its original treatment.
- Two Tier 2 schools shared a guidance counselor. These schools were not co-located, but with the same counselor, there was a chance of spillover. One school was originally assigned to Fast Facts, low odds, digital delivery, and one to control. Thus, the control school was switched to the Fast Facts, low odds, digital delivery treatment. Another school in the same block (originally assigned to the App) that had not yet been contacted was switched to control. All schools are assigned to their original treatment status in the analysis.
- Other:
- One school which volunteered for the experiment should have been assigned to a treatment, but was originally assigned to control. When we realized this error, we assigned that school non-randomly to the App.

The randomization as implemented, reflecting these last few nonrandom assignments, is shown in Figure A.3. Ultimately, 135 schools received some for of the Fast Facts treatment, 56 schools received the App, 58 schools received School Finder and 59 schools served as controls. However, note that estimation always uses the intended assignment and should be considered an intent-to-treat analysis.

## A. 2 Details on the intervention materials

The study team produced the Fast Facts sheets and website; details of the production are described below. The App was created and managed by the Heckscher Foundation for Children at the time of the study. The study team consulted with the App creators to refine their school list algorithm. A description of the App and the inputs to the search algorithm is below. Finally, the NYCDOE produced School Finder as an electronic, searchable version of the NYC High School directory. It is described below.

## A.2.1 Fast Facts

A version of the Fast Facts school list was the largest treatment arm in the study. The goal of the Fast Facts list was to highlight nearby schools with relatively high graduation rates that students had a chance of getting into (based on the choice history at their middle school), while limiting application to low-graduation rate schools. The Fast Facts list was listed in descending order by graduation rate, and the list included the name of the school, the graduation rate, the commuting time between the middle school and the high school, the page in the directory, and a short guide to what to do to apply to that school based on program admissions methods (e.g. for screened programs, students the list indicated "Check if you have the grades;" for limited unscreened schools, "Go to an open house/fair and sign in"). The Fast Facts treatment also included some basic information about the high school admissions process and program admissions methods, adapted from NYCDOE materials.

Fast Facts was distributed both as a paper sheet (see Figures E. 1 to E.3) and digitally, as a website (see Figures E. 5 and E.6). There were three versions of the high schools listed in Fast Facts, the baseline list, a list that also highlighted two "low graduation," high schools, and a list that highlighted two "low odds" high schools. There was also a supplemental list targeted to English
learners. All three versions of the Fast Facts lists were produced for all study schools, including those in alternative treatment arms and in the control group, for comparison purposes.

This section describes the process to generate the baseline Fast Facts list, with the variations and supplemental list described in more detail below.The data used to generate the Fast Facts lists came from the following sources:

- High school information, using the 2016-2017 NYC High School Directory as the authoritative list of high schools. We supplemented the directory information with other high school data sources:
- The School Quality Review data from 2014-2015 (the same year as the source data for the directory) for school performance information and identification of transfer high schools,
- The School Demographic Snapshot data from 2016 (to identify single sex schools),
- High School Admissions Process data from 2014-2015 to identify high schools with more than half of their students entering the school as continuing 8th graders;
- Travel time between each middle school and each high school pair in NYC from Google Maps, by walking or public transit;
- Middle school choice history using six years of HSAPS data, 2009-10 to 2014-15. This includes for each middle school-high school combination: the total number of matches to that high school, the total number of choices for that high school, the total number of relevant choices (schools at least as highly ranked as the one the student was matched to), matches as a percent of all choices, and matches a percent of all relevant choices. When there was not middle school choice history information, we substituted choice history information aggregated at the district level.

When schools are missing a graduation rate due to being a new school, we impute a predicted graduation rate from a regression on a quadratic of the on-track indicator (percent of 9th graders earning 10 or more credits), percent of all programs in the high school that are screened, percent of all programs in the high school that are screened language. We use the upper bound of a 95 percent confidence interval on this prediction to determine inclusion in the Fast Facts high school set, but do not display imputed graduation rates on Fast Fact lists, instead substituting a note that the school was new.

We begin with the 440 high schools listed in the directory, and eliminate specialized high schools and LaGuardia, single sex schools, high schools where more than half of students are continuing 8th graders, and transfer high schools. We only include high schools on Fast Facts with at least a reported or imputed graduation rate of $70 \%$ (preferring a graduation rate of $75 \%$ where possible): this leaves 250 high schools as candidates for inclusion on a Fast Facts list.

The goal of the Fast Facts list generation procedure was to generate a list of 26 schools within a 45 minute commute of the middle school, with a graduation rate of at least $75 \%$, where there was some history of successful matches to that high school in the middle school. In some cases, these guidelines were relaxed to generate a list of 26 schools. The specific procedure to generate a list of schools eligible to be listed on Fast Facts, using imputed graduation rates for new schools, went through the following steps in this order until at least 26 schools were identified:

1. Flag all high schools within 45 minutes of the middle school that have a graduation rate of $75 \%$ or higher, where at least one student from that middle school had chosen the high school in the past six years, and at least one student had matched to the high school. Add to this pool schools in the top 15 of a middle school's match history, as long as the graduation rate was at least $75 \%$ and the commute less than 65 minutes. ${ }^{47}$
2. Add in schools within a 60 minute commute, retaining the graduation rate floor and the choice history criteria.
3. Add in schools within a 45 minute commute, but with a graduation rate of at least $70 \%$, maintaining the choice history criteria.
4. Add in schools within a 45 minute commute, but with a graduation rate of at least $70 \%$, maintaining the choice history criteria.
5. Add in schools within a 60 minute commute, but with a graduation rate of at least $70 \%$, maintaining the choice history criteria.
6. At this point, the same four steps as above were followed, but using geographic district choice history instead of middle school choice history. ${ }^{48}$ This included both cases where middle schools that did not have any choice history information and cases where the choice history criteria eliminated a high school from consideration. The process ended here, even if 26 eligible high schools were not found.

This procedure identified 26 or more eligible schools for almost all middle schools; only 10 middle schools ( $1.6 \%$ ) were not able to complete a list. ${ }^{49}$

At this point, the list of eligible high schools needed to be refined to 26 schools. The principles here were to include schools for which there was a past history of successful matching, a variety of admissions methods, and a range of choices to appeal to multiple types of students, within the group of schools meeting the criteria for inclusion listed above. The procedure to refine the list was:

1. The pool of potential Fast Facts high schools was sorted in descending order by number of past matches to that high school, using the choice history of the middle school, and if missing, the choice history of the geographic district. Sorting by match history both highlights schools that students have been successful at in the past and prevents the list from being dominated by screened schools. Ties were broken to prioritize 1) schools that admitted students by nonscreened admissions methods, and 2) match rate to that high school using the choice history as described above. High schools were sorted in descending order by graduation rate.
2. Since this method necessarily will reduce the number of newer schools on the Fast Facts list due to prioritizing match history, we added up to three new schools to the list so that a list would not exclude potentially beneficial options solely because they were new. We considered a new school for inclusion if it was in the same borough and admitted some non-screened

[^1]students. We prioritized new schools in the same geographic district, and then by imputed graduation rate. New schools were substituted for the lowest school on the list from the step above that was not a new school. The list was then resorted by graduation rate, though imputed graduation rates were not displayed, but marked with "*new."

In short, the Fast Facts list was a list of 26 nearby schools, with relatively high graduation rates, which prioritized high schools that students in that middle had successfully matched to in the past. There are a few contrasts to the similar lists we developed for Corcoran et al. (2018) which should be highlighted. The 2016-17 Fast Facts had 26 schools, rather than 30 , and a higher graduation rate floor ( $75 \% \mathrm{vs} .70 \%$ ). Furthermore, the prior year's version did not include match history in the selection process.

## A.2.2 Supplementary "Low Graduation" and "Low Odds" Schools for Fast Facts

For schools assigned to the Fast Facts "low graduation" and "low odds" treatments, the above procedure was followed, but the last two schools on the list were omitted, leaving a list of 24 high schools. This left two spots remaining on the list to include two schools that met additional criteria. The goal of the supplemental schools was to highlight the importance of considering odds of admission and the graduation rate of schools. This was done by including a short text above the list of supplemental schools. As can be seen in Figure E.2, in the case of "low graduation" Fast Fact lists, the message read: "Some students apply to the schools below, but students at these schools are less likely to graduate than at other schools on the list." For "low odds" Fast Fact lists, the additional text read: "Warning: you may have a lower chance of getting into the schools below!" (see Figure E.3). In these cases, the Fast Facts sheet did not include information about how to apply to one of these schools.

The supplemental schools were selected as follows:

1. Identify schools in the commuting radius not listed on the Fast Facts sheet that were either "low odds" high school choices (less than $20 \%$ match rate among historic relevant choices) or "low graduation" (graduation rate less than 70\%).
2. Select the two schools from the above lists that that were chosen most often in the school's history.
3. To ensure that the supplemental schools were not rarely chosen at that school, calculate the share of total choices from that middle school's choice history occupied by each school on the supplemental list. Retain schools that account for at least $1.5 \%$ of the choice history.
4. If an additional supplemental school is needed, or if a middle school did not have a choice history, substitute schools from the geographic district. "Low odds" in this case is defined as a less than $10 \%$ match rate (among historical relevant choices).
5. If a supplemental school is identified as both "low odds" and "low graduation" rate, we omit that school from the low odds list, substituting the next school that meets the criteria above. This situation happened rarely.

## A.2.3 Screened language insert

The high school admissions process may be especially challenging for students new to the United States and those who are learning English. We thus provided the screened language insert (Figure E.4), a one-page list of 38 programs citywide that exclusively served such students. The list was available as a paper flyer in English and Spanish for all schools in the Fast Facts paper treatment arms and as a tab on the Fast Facts digital delivery website. The insert highlighted the school name, program name, program code, directory page number, and language(s) served. Programs were included on the insert if they had a 6 -year graduation rate above $75 \%$.

## A.2.4 Fast Facts list characteristics

By design, the high schools listed on the Fast Fact sheets across all treatment groups all had similar characteristics in terms of graduation rates, admissions, and location. Descriptive statistics on the comparison between the three Fast Facts treatment types as well as across the two delivery methods can be found in Table B.1. More than three quarters of them were located in the same borough as the middle schools from which they received students. The average travel time between these schools and middle schools is between 33 to 35 minutes. In terms of admission outcomes, schools had approximately $150-153$ seats to offer, with an average of 12 applications per seat. The recommended high schools had an average graduation rate of $86 \%$, and over $\% 95$ of schools had graduation rates of over $75 \%$. The differences between these treatment group means and those from the control group are not statistically significant. Balance tests include indicators for randomization blocks. Apparent differences across columns are due to the fact that no control schools were in Tier 1.

The supplemental schools for the "low odds" and "low graduation" treatment arms are described in Table B.2. As expected, low odds schools tend to have very high graduation rates, and low graduation rate schools average a graduate rate of about $60 \%$. Low odds schools are quite popular, with more than 30 applicants per seat, and low graduation rate schools tend to be large programs, averaging over 2009 th grade seats per school. In almost all cases, low graduation rate schools are in the same borough as the middle school, though low odds schools are slightly more likely than the average Fast Facts school to be out-of-borough.

## A.2.5 The NYC High School Admissions Guide "App"

The NYC High School Admissions App was created by the Heckscher Foundation for Children. It was a downloadable smartphone application, also available as an interactive website. The research team worked with the Foundation to fine-tune the search procedures and ensure that the App emphasized schools with graduation rates above a floor. To use the App, students provide their home address, middle school, borough preferences, distance preference (willingness to travel more than 45 minutes), academic interests (select up to 4 of 7 categories), and sports/activities interests (select keywords). The App then provides 20 program matches based on a search procedure that tries to satisfy all of the student's preferences. If fewer than 20 programs are returned, the app progressively relaxes students' preferences, beginning with extracurricular activities. Some details on the App search procedure:

- Schools with graduation rates less than $65 \%$ are omitted from search results, however students may look up these schools manually if they wish. When more than 20 programs meet the
desired criteria, higher graduation rate schools are prioritized for the list of results.
- Schools with travel time greater than 75 minutes are omitted altogether, although again students may search for these schools manually. The student only receives recommendations between 45 and 75 minutes if they state a willingness to travel further than 45 minutes.
- Programs are internally assigned "priority code" so that students are more likely to see recommendations of schools where they have a higher probability of admission (e.g. their own borough). Additionally, there are a few ad hoc controls to ensure students are not given recommendations where their chance of admission is zero. For example, District 2 screened schools when the student is not a District 2 resident or does not attend a District 2 school already. Special schools like those only for recent arrivals are omitted, since we have no way of knowing if they meet this criteria.

Students assigned to the App treatment received materials encouraging its use and showing how to use it. Students in other treatment arms and the control group were not restricted from accessing the App but were not encouraged to do so. The postcard supplied to guidance counselors to share with students to help them access the App is available in Figure E.7; screenshots of the App are available in Figure E.8.

## A.2.6 School Finder

School Finder was released in summer 2016 by the NYCDOE as a searchable, online high school directory, which was sortable by alphabetical order or distance from a particular location. Students could access it through the NYCDOE website or directly (at SchoolFinder.nyc.gov), and it is now embedded in the MySchools.nyc, the portal used to apply to schools in NYC. In previous years, the high school directory was available online as a downloadable PDF. To access listings of schools, School Finder was searchable by keyword (e.g. basketball, science, debate, arts) and location. Results could further be filtered by school size, borough, distance from a particular zip code, program admissions method (e.g. screened, zoned), and accessibility. ${ }^{50}$ School lists generated by these search and filter criteria were sortable by distance or school name. Clicking on a school name opened up more details about the school, including a summary written by the school, performance information, activities listings, and information about program and priorities. This is the same information that was available in the high school directory. It was not possible to sort schools by graduation rates or other performance criteria.

Importantly, students in control group schools also had access to School Finder, and all guidance counselors could participate in training from the NYCDOE on School Finder. However, there were not targeted activities that schools were required to engage in using School Finder. The postcard supplied to guidance counselors to share with students to help them access School Finder is available in Figure E.9; screenshots of School Finder are available in Figure E.10.

[^2]Figure A.1: Randomization Design

Notes: The above figure shows treatment assignment as of summer 2016. For visual clarity, the within Fast Facts variation treatment arms are not shown.

Figure A.2: Randomization Design, After Orthogonal Post-Randomization Updates

Notes: The above figure shows treatment assignment after orthogonal post-randomization adjustments were made. This includes schools that were closed or consolidated, which did not serve 8th graders, or a school that was randomly drawn from Tier 3. For visual clarity, the within Fast Facts variation treatment arms are not shown.

Figure A.3: Randomization Design, After All Post-Randomization Updates

Notes: The above figure shows treatment assignment after orthogonal and nonrandom post-randomization adjustments were made. This includes schools that were closed or consolidated, which did not serve 8th graders, or a school that was randomly drawn from Tier 3. The nonrandom adjustments are for schools whose treatment status changed due to participation in the experiment. For visual clarity, the within Fast Facts variation treatment arms are not shown.

Table A.1: Middle School Characteristics

|  | All schools <br> (1) | Study schools $(2)$ | Tier 1 (3) | Tier 2 <br> (4) |
| :---: | :---: | :---: | :---: | :---: |
| (A) Graduation rates: |  |  |  |  |
| Charter | 0.166 | 0.190 | 0.081 | 0.247 |
| Bronx | 0.243 | 0.260 | 0.366 | 0.205 |

Notes: This table shows means of school-level characteristics from 2015-2016 for each group listed in the column heading. Tier 1 indicates middle schools that participated in the 2015-2016 experiment; Tier 2 middle schools new to the experiment in 2016-2017. In 2015, NYCDOE began to use average income in place of free reduced lunch to determine poverty status for schools.

| Notes: This table shows means characterizing the schools on the Fast Fact lists at each middle school by treatment group, which are the means of averages calculated at the middle school level. Fast Facts lists were generated for all schools in the study, regardless of treatment status, though are not displayed for schools in the App or School Finder treatment arms. The p-values are from regressions of the listed high school characteristic on a set of treatment group indicators and randomization block fixed effects. Due to cross-randomization, the first p-value (column 7) corresponds to the type of FF list, the second (column 8) to the delivery method. The null hypothesis tested is that the coefficients on the treatment indicators are jointly zero. The graduation rate and graduation rate $\geq$ outcomes are conditional on being non-missing. Total seat counts do not include zoned guarantee programs, which do not have a maximum seat count. |  |  |  |  |  |  |  |  |

Online Appendix 23
Table B.2: Mean Characteristics of Schools on Fast Facts and Control Schools

Online Appendix C: Additional results and robustness checks

Figure C.1: Distribution of Unique Views of Fast Facts Digital

Notes: This figure shows the frequency of unique views of the the Fast Facts website by middle school. One Fast Facts Digital outlier with a unique views count of 310 is topcoded in this figure and is included as 100 views. The dashed line indicates 5 views, which is the cutoff point used to indicate that FF digital was utilized by a particular school.

Figure C.2: Simulated Admissions Probabilities for First Choice High Schools

Notes: This figure shows the simulated admissions probabilities for first choice high schools from 1,000 lottery randomizations that apply the deferred acceptance algorithm to generate empirical probabilities. The sample includes all students in study schools.

Figure C.3: Distribution of graduation rates of top 3 choices and enrolled school
A. Fast Facts vs. Control

Notes: This figure shows the distribution of demeaned graduation rates for the top three choices (left panels) and enrolled schools (right panels) by treatment group. Graduation rate is demeaned by block, so the figure reflects within block comparisons, to correspond more directly to the regression models used here. This demeaning occasionally results in graduation rates over $100 \%$.

Online Appendix 28

Figure C.4a: Distribution of graduation rates of top three choices by admissions probability at top three choices
A. Fast Facts Paper

—— FF Paper \& Admit Probability > $0 \quad$ Control \& Admit Probability > 0
—. FF Paper \& Admit Probability $=0$ —. Control \& Admit Probability $=0$
B. Fast Facts Digital

- FF Digital \& Admission Probability >0-Control \& Admit Probability $>0$
—. FF Digital \& Admission Probability $=0$ —. Control \& Admit Probability $=0$

Notes: This figure shows the distribution of demeaned graduation rates for the top three choices separated by those with a non-zero admission probability (solid lines) and those with a zero admissions probability (dashed lines) for treatment and control groups. Graduation rate is demeaned by block, so the figure reflects within block comparisons, to correspond more directly to the regression models used here. This demeaning occasionally results in graduation rates over $100 \%$.

Figure C.4b: Distribution of graduation rates of top three choices by admissions probability at top three choices

Notes: This figure shows the distribution of demeaned graduation rates for the top three choices separated by those with a non-zero admission probability (solid lines) and those with a zero admissions probability (dashed lines) for treatment and control groups. Graduation rate is demeaned by block, so the figure reflects within block comparisons, to correspond more directly to the regression models used here. This demeaning occasionally results in graduation rates over $100 \%$.

Notes: This table reports regression coefficients representing assignment to an informational intervention middle school oon admissions probabilities of high school choices. Admissions probabilities come from simulating the admissions lottery 1,000 times and calculating the empirical probability of admission to a school choice. All regressions include controls for the variables listed in Table 1, as well as for randomization block by year fixed effects. The estimation sample includes all students present in October of their 8th grade years in the 2016-2017 and 2017-2018 school years who attended randomization sample schools and participated in the Round 1 high school choice process. Robust standard errors clustered by middle school are in parentheses ( $+\mathrm{p}<.10$ * $\mathrm{p}<.05$ ** $\mathrm{p}<.01$ ).

Notes: This table reports regression coefficients representing assignment to an informational intervention middle school on graduation rates of high school choices, matched school, and enrolled school, with imputations. Outcomes labeled "(Imp)" include imputed graduation rates based on on-time progress variables for high schools that have such variables. Outcomes labeled "(Double Imp)" include imputed graduation rates described above, and impute mean graduation rates by borough for high schools that are still missing graduation rates. All regressions include controls for the variables listed in Table 1, as well as for randomization block by year fixed effects. The estimation sample includes all students present in October of their 8th grade years in the 2016-2017 and 2017-2018 school years who attended randomization sample schools and participated in the Round 1 high school choice process. Robust standard errors clustered by middle school are in parentheses ( $+\mathrm{p}<.10^{*} \mathrm{p}<.05^{* *}$ $\mathrm{p}<.01$ ).

Notes: This table reports regression coefficients representing assignment to an informational intervention middle school on key outcomes, seperately for several samples. Nonoptimal first choice strategy indicatates first choice application to a high school with a graduation rate below $75 \%$ that also has with guaranteed simulated admission probability. All regressions include controls for the variables listed in Table 1, as well as for randomization block by year fixed effects. The estimation sample is labeled in each row. Robust standard errors clustered by middle school are in parentheses $\left(+\mathrm{p}<.10^{*} \mathrm{p}<.05^{* *} \mathrm{p}<.01\right)$.

Notes: This table reports regression coefficients representing assignment to an informational intervention middle school on high schools listed on the Fast Facts interventions. The On Track indicator includes students who obtain at least 10 credits and do not fail any academic classes in a given year. All outcomes are conditional on attending an NYC DOE school in 9th and 10th grade. All regressions include controls for the variables listed in Table 1, as well as for randomization block by year fixed effects. The estimation sample includes all students present in October of their 8th grade years in the 2016-2017 and 2017-2018 school years who attended randomization sample schools and participated in the Round 1 high school choice process. Robust standard errors clustered by middle school are in parentheses ( $+\mathrm{p}<.10^{*} \mathrm{p}<.05^{* *} \mathrm{p}<.01$ ).

Table C.6: Impact of Informational Interventions on Choices from Fast Facts

| Notes: This table reports regression coefficients representing assignment to an informational intervention middle school on school characteristics, separated by use. All regressions include controls for the variables listed in Table 1, as well as for randomization block by year fixed effects. The estimation sample includes all students present in October of their 8th grade years in the 2016-2017 school year who attended randomization sample schools and participated in the Round 1 high school choice process. Use was determined by an affirmative response for indicating sharing the intervention with students or parents in any of the following: a follow-up call with the research team to confirm receipt of the materials, a survey distributed to all guidance counselors, or an interview with a sample of guidance counselors. Some schools have multiple personnel responsible for high school admissions; an affirmative response from any of these staff members was considered as use for that school. Schools without a response to any of the above are included as non-responders, and all control schools are used. The sample is limited to the first cohort, as this is the group with detailed use information, and some treatments were changed in the second year of the intervention. Robust standard errors clustered by middle school are in parentheses $(+$ $\left.\mathrm{p}<.10^{*} \mathrm{p}<.05^{* *} \mathrm{p}<.01\right)$. |  |  |  |  |  |  |  |  |

Notes: This table reports regression coefficients representing use of School Finder on school characteristics. All regressions include controls for the variables listed in Table 1, and, in lieu of randomization block by year fixed effects, a borough fixed effect. The estimation sample includes all students present in October of their 8th grade years in the 2016-2017 school year who attended control group schools and participated in the Round 1 high school choice process. School Finder use was determined by an affirmative response from a survey distributed to all guidance counselors or an interview with a sample of guidance counselors. Some schools have multiple personnel responsible for high school admissions; an affirmative response from any of these staff members was considered as use for that school. Schools without a response to any of the above are included as non-responders, and all control schools are used. The sample is limited to the first cohort, as this is the group with detailed use information, and some treatments were changed in the second year of the intervention. Robust standard errors clustered by middle school are in parentheses ( $+\mathrm{p}<.10^{*} \mathrm{p}<.05^{* *} \mathrm{p}<.01$ ).

## 

## $\oint \begin{gathered}\text { Grade } 7 \text { mastered, got done, spun out the door, want a } \\ \text { High school, stuck in the middle of a confusing spot }\end{gathered}$ in your application <br> t's monstrous, so astonished, you holle <br> Call me up a hero or a scholar

Welcome to $8^{\text {th }}$ grade! This year, you have to submit a high school application. You will get your application in October. Here are some tips to help you with the application: when you first get it, check your 7 th grade attendance, grades, and test scores at the bottom. Why does this matter? Some schools (called screened schools) will use this information to decide whecher to offer you a spot. Others (limited unscreened schools) won't see any of this information at all. Once
you've checked it, put it in a safe place! It's due on December I', and your parent or guardian has to sign it.

$$
\begin{aligned}
& \text { Just one offer, we have tools so you won't falte } \\
& \text { Get a lot farther by searching a lot harder } \\
& \text { By being a lot smarter } \\
& \text { By being a self-starter } \\
& \text { By thirteen, they declared you } \\
& \text { are a high school decider }
\end{aligned}
$$

"Iust one offer" means you only get accepted to one school from your main application. How do you find the best school "Ust one offer" means you only get accepted to one school from your main application. How do you find the best school
for you? Weve made a special list for your school that we call "Fast Facts" (http://FastFactsNYC.com). The list has schools that are mostly a short distance from where you live. We picked these schools because kids at these schools are more likely to graduate from high school. Actually, all of the high schools on Fast Facts have graduation rates that are above average!
Why does that matter? You might think that all schools are the same. But at some schools, a lot of kids don't graduate. If you don't graduate from high school, it's harder to get $a$ job later, and you can't go to college without finishing high school. So when youre checking out high schools, always look at the graduation rate! The groduation rate is listed for al of the schools on your Fast Facts list For other schools, check out the High School Directory, which some 8th graders cal
"the book" or "the high school book."
Here is the way, be brave, your high school path uncharted Inside, you are longing for a school to be a part of Dare to visit a school fair Your counselor is your partner

High schools often have a theme, like heath professions, humanities, science and engineering, or history. Think about what subjects you like and look for schools that fit your interests. Visiting a school fair or open house is a great way to visiting a fair or open house also gives you priority for admission. Remember, the Borough Fairs are October $15^{\text {"n }} \&$

Screened schools sometimes require that you fill out an additional application telling the school why they should pick you. Remember, screesed schools may look at 7th grode ELA and math state exams, grodes, and ottendance. Some ask you to do an in- person interview, write an essay, or visit the school. Some schools require essays with questions such as, "Why
should we choose you?", "How would your friends describe you?", and "What extracurriculars do you participate in and what does that reveal about you"" If a school you like requires an interview, remember that preparation will make you less nervous. Try doing a practice interview at home with friends or family, or ask someone at school to practice with you.

Applying to high school might seem complicated, but if you make a game plan and follow it, you'll be ready to tackle anything. Use "My Checklist" to keep track of what you need to do over the next few months. The "My Notes" sheet has space for you to take notes on the schools and keep track of the open house dates of schools you want to visit.

Travel time is important to consider. Can you wake up early every morning to get to a school that's far away? Do you Trave time is important tho consider. Can you wake up early every morning to get to a schoor thats far away? Do you
want to go to a school that you can walk to instead? Make sure to check Google Maps to see how long it will take you want to go to a school that you can walk to instead? Mak
to get to and from the high schools you are interested in!

Schools have different graduation rates, which means you are more or less likely to finish high school depending on which school you go to. A higher graduation rate means you are more likely to finish and have the option to go on to college. The average graduation rate for the city is about $70 \%$ : that's what we mean by $7-0$. Once youve checked the graduation ate, use your "My Draft Application" sheet to practice filing out your appl by 7 . with your parents, guidance counselor, or another adult you trust and finalize your list. This way, when it's time to fil

Signin' up for every audition you intend on
$\oint$ Scanning for open house dates with your pen drawn
Ask your teachers to lend their helping hand, and
Put down as many schools as you can
Some schools require an audition to be admitted and others (limited unscreened schools) give you priority ifyou attend an open house. Look in the directory to check the requirements for schools you're interested in, and if you need to, call If they are required, so you have a better chance of being accepted to. Make sure to if they are required, so you have a better chance of being accepted to these schood

Make sure you fill all the spots on your application!'When you pick 12 schools, you have a much better chance of getting into one of your choices in the first round of the admissions process and going to a high school you like next year.

$6^{A}$ genius in the works is born A genius in the works is bo
See if you can spot him Your plans so intricate
Your GC knows you've got ' ou're all done with your high school all done with your high school app
Man your list is awesome Remember, your application is due to your guidance counselor on December | $\mid$ ! As long as you followed your game
plan, you should have 12 great schools picked out and be ready to hand in your application by the deadline.

$6^{\text {There's a million things to factor i }}$ So just don't wait!
What's What's your game plan? This high school is my number 1!
